

Why Does Skin Look Different After Weight Loss?

Rapid weight loss, often associated with GLP-1 medications, can lead to unexpected and unwanted changes in your appearance.

While the health benefits can be meaningful, the physical changes aren't all welcome. Skin may look thinner or looser, with changes in softness or contour across areas such as the face, breasts, abdomen, thighs, or other parts of the body.

These changes can feel frustrating, confusing, and even discouraging, especially when the weight loss itself was welcome.

In many cases, these changes are linked to the loss of the underlying "good fat" that supports healthy skin.

What's Really Happening?

The Importance of "Good Fat"

In a world where fat is often viewed negatively, it's easy to forget that fat provides the foundation for healthy, youthful-looking skin.

When this foundation is lost, skin can appear thinner, looser, and less supported.

Healthy skin depends on healthy underlying fat.

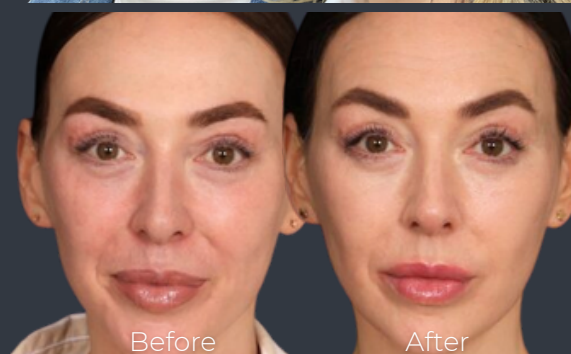

When the body loses this foundation, restoring it like-for-like matters.

Lipoderma®

Built on the Biology of "Good Fat"

As a first-of-its-kind natural fat restoration solution, Lipoderma restores "good fat" with "good fat," supporting the foundation beneath the skin the way natural fat does.

The Lipoderma Difference

Restoring the Foundation: What to Know

Is Lipoderma like a filler?

Lipoderma isn't a traditional filler. Fillers temporarily add volume, but they don't replace the fat that supports healthy-looking skin. Lipoderma restores the "good fat" beneath the skin, rebuilding the natural foundation that keeps skin looking supported and healthy.

How is it different from fat transfer?

Fat grafting uses your own fat through a surgical liposuction procedure. Lipoderma offers the same natural benefits without surgery; it's ready to use, safe, and consistent for beautiful, reliable results.

What is the procedure like?

It is a quick in-office treatment under local anesthesia. A needle or cannula is used to place Lipoderma beneath the skin in the natural fat layer.

What is recovery like?

You may notice mild swelling or bruising that will resolve within a few days. You can return to normal activities immediately.

When will I see results?

You'll see improvement right away, with results that continue to refine over the following weeks and months as the tissue naturally integrates.

Is it safe?

YES! Lipoderma is FDA-registered and processed under the highest safety and sterility standards.
